**Table F2-4. Modeled Tissue Mammalian TEQ Concentrations**
**Anniston PCB Site, Anniston, Alabama**

**Notes:**
BAF: bioaccumulation factor
DL-PCB: dioxin-like polychlorinated biphenyls
dw: dry weight
LAA: lower assessment area
MAA: middle assessment area
NA: not applicable
mg/kg dw: milligrams per kilogram dry weight
ND: nondetect
ng/kg dw: nanograms per kilogram dry weight
PCDD: polychlorinated dibenzo-p-dioxin
PCDF: polychlorinated dibenzofuran
SED: sediment
SO: soil
TEC: threshold effect concentration
TEF: toxic equivalency factor
UAA: upper assessment area

**Table F2-5. Modeled Tissue Avian TEQ Concentrations**
**Anniston PCB Site, Anniston, Alabama**

**Notes:**
BAF: bioaccumulation factor
DL-PCB: dioxin-like polychlorinated biphenyls
dw: dry weight
LAA: lower assessment area
MAA: middle assessment area
NA: not applicable
mg/kg dw: milligrams per kilogram dry weight
ND: nondetect
ng/kg dw: nanograms per kilogram dry weight
PCDD: polychlorinated dibenzo-p-dioxin
PCDF: polychlorinated dibenzofuran
SED: sediment
SO: soil
TEC: threshold effect concentration
TEF: toxic equivalency factor
UAA: upper assessment area

**Table F2-6. Modeled Tissue Fish TEQ Concentrations**
**Anniston PCB Site, Anniston, Alabama**

**Notes:**
BAF: bioaccumulation factor
DL-PCB: dioxin-like polychlorinated biphenyls
dw: dry weight
LAA: lower assessment area
MAA: middle assessment area
NA: not applicable
mg/kg dw: milligrams per kilogram dry weight
ND: nondetect
ng/kg dw: nanograms per kilogram dry weight
PCDD: polychlorinated dibenzo-p-dioxin
PCDF: polychlorinated dibenzofuran
SED: sediment
SO: soil
TEC: threshold effect concentration
TEF: toxic equivalency factor
UAA: upper assessment area

**Notes:**
COPC: constituent of potential concern
dw: dry weight
EPC: exposure point concentration
kg: kilogram
kg dw/kg-day: kilograms dry weight per kilograms per day
ng/kg: nanogram per kilogram
NOAEL: no observed adverse effect level
OU: Operable Unit
TEQ: 2,3,7,8-polychlorinated dibenzo-p-dioxin toxic equivalent
TRV: toxicity reference value
**Bold indicates hazard quotients greater than 1**

**Notes:**
COPC: constituent of potential concern
dw: dry weight
EPC: exposure point concentration
kg: kilogram
kg dw/kg-day: kilograms dry weight per kilograms per day
ng/kg: nanogram per kilogram
NOAEL: no observed adverse effect level
OU: Operable Unit
TEQ: 2,3,7,8-polychlorinated dibenzo-p-dioxin toxic equivalent
TRV: toxicity reference value
**Bold indicates hazard quotients greater than 1**

**Notes:**
COPC: constituent of potential concern
dw: dry weight
EPC: exposure point concentration
kg: kilogram
kg dw/kg-day: kilograms dry weight per kilograms per day
ng/kg: nanogram per kilogram
NOAEL: no observed adverse effect level
OU: Operable Unit
TEQ: 2,3,7,8-polychlorinated dibenzo-p-dioxin toxic equivalent
TRV: toxicity reference value
**Bold indicates hazard quotients greater than 1**

**Notes:**
COPC: constituent of potential concern
dw: dry weight
EPC: exposure point concentration
kg: kilogram
kg dw/kg-day: kilograms dry weight per kilograms per day
ng/kg: nanogram per kilogram
NOAEL: no observed adverse effect level
OU: Operable Unit
TEQ: 2,3,7,8-polychlorinated dibenzo-p-dioxin toxic equivalent
TRV: toxicity reference value
**Bold indicates hazard quotients greater than 1**

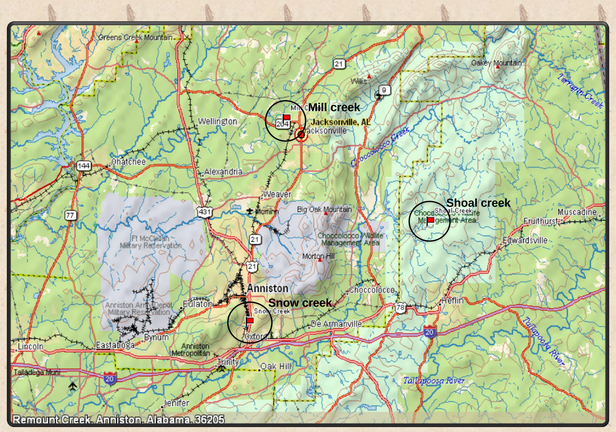
## Abstract

Snow creek is a perennial tributary of Choccolocco creek, Oxford, Alabama. In the 1970s, Snow creek was polluted by industrial heavy metals and PCBs. In those years, high concentrations of contaminants resulted in the death and/or migration of many aquatic organisms from the creek. Cleanup efforts began in the 1980s and the water conditions in the creek are better, nonetheless, mercury (Hg) and PCBs can still be measured in stream soils. A diversity of aquatic organisms currently inhabit the creek, including many sensitive species. We have been examining oxygen consumption rates in fishes currently inhabiting Snow creek and other unimpacted regional streams. Our goal was to determine if fishes inhabiting Snow creek had altered metabolic rates, indicating potential stress. Fish examined from unimpacted streams included those inhabiting Shoal creek, a relatively pristine site in the Talladega National Forest, AL, and Mill creek, a relatively unimpacted site in Jacksonville, AL. Weight specific metabolic rates for fishes inhabiting Snow, Shoal, and Mill creeks, respectively, range from 200-400 $mgO_2/kg*hr$. Data is variable at all three sites and no apparent trends have been determined at this time. We have also been examining gill malformations using SEM. Previous studies have demonstrated gill damage and osmoregulatory stress in fishes chronically exposed to Hg and PCBs. In our study, alterations in gill morphology of fishes from Snow creek are inconclusive. We hypothesize that, although contaminants may linger, the stream appears suitable for aquatic life, as indicated by the number of species currently inhabiting the stream. Fishes in the stream show no apparent physiological stress, further indicating the stream may be recovering.

Stoneroller, *Campostoma oligolepis*

## Introduction

Snow creek is a tributary within the Choccolocco creek watershed that was victim to industrial pollution in the 1970s. Both PCBs and heavy metals were once found in high concentrations in the creek and surrounding soils. During the height of pollution no species were known to inhabit the creek. Since that time, release of contaminants by responsible industries has ceased. Monitoring of the creek chemistry including water quality and soil sampling has remained constant since the time of impact, although recovery of organisms living within the system has not been evaluated. 30 years later, we are interested in assessing recovery of fishes inhabiting the creek. Current community populations show an increase in species diversity similar to other undisturbed regional streams indicating the stream is at least inhabitable. Recovery will be determined through comparison of metabolic rates and gill morphology. Metabolism, as determined by oxygen consumption rates has been shown to increase in response to exposure to heavy metals and PCBs. Alterations in gill morphology has also been shown in fishes exposed to these contaminants resulting in osmoregulatory stress. The goal of this project is to determine the extent of recovery seen in fishes inhabiting a historically impacted site.



Map showing relative location of three sites.

## Methods

Stonerollers were collected from Snow creek and two other regional streams. Mill creek is a relatively undisturbed site in Jacksonville, AL. Shoal creek is a relatively undisturbed site located in the Talladega National Forest. A backpack electroshocker was used as the method of collection. Oxygen consumption rates were determined using a closed-loop respirometer (Loligo Systems)

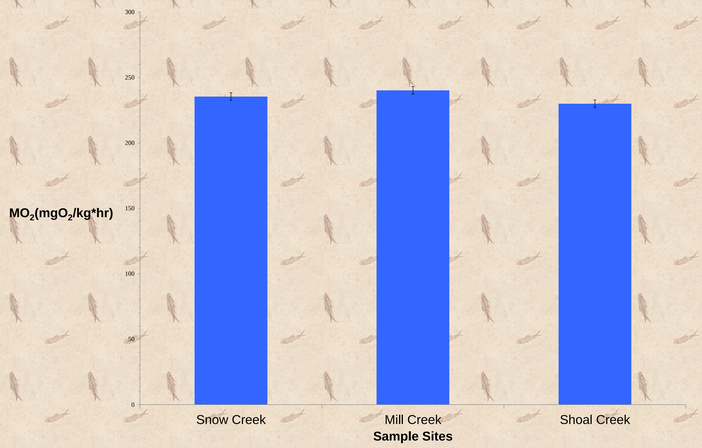
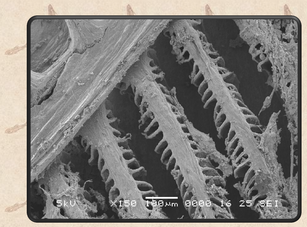
Scanning Electron Microscope

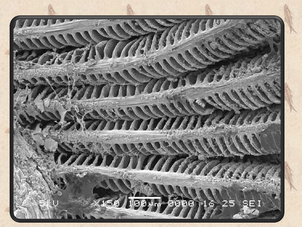
## Results

Oxygen consumption rates were not significantly different between Snow Creek and the two reference sites. Thus metabolic expenditure in fishes from Snow creek is similar to those inhabiting “healthy” streams. Examination of gill morphology does not indicate damage associated with exposure to PCBs or heavy metals.

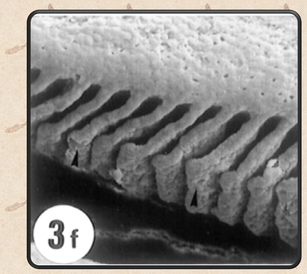




Snow creek gills at 150x magnification



Mill creek gills at 150x magnification



Swelling of lamellae in fish exposed to heavy metals at 150x
(Ribeiro et al., 2000)

Lamellae fusion and hyperplasia in fish exposed to heavy metals at 700x
(Ribeiro et al., 2000)

## Conclusion

Metabolic data and gill morphology examined in this study as well as other indicators such as IBIs suggest the Snow creek has made some recovery.
